The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (ACLIS and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information in the bovine propried herein (see below). The sequence information specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

Table 7; Page 257; 517pp; English

```
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 olds one cone out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
con in the bovine genome is estimated at >100,000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
constream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
connomically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

```
The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has been determined are shown in AAT65704 or correct sequence is from the marker clone Mdfils which contains the repeat sequence is from formula: (AC)18. (Updated on 25-MAR-2003 to correct PF field.)

Claim 1; Col 13-14; 186pp; English

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

Disclosure; Col 9-10; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdfill which contains the repeat sequence having the formula: (AC)18. (Updated on 25-MAR-2003 to correct PF field.) Sequence 36 BP; 18 A; 18 C; 0 G; 0 T; 0 U; 0 Other;

```

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence crepeat (SSR), having 2 or more tandemly repeated nucleit decree elements 2-6 nucleotides in length. Also included are a nucleic acid primer 2-6 nucleotides in length. Also included are a nucleic acid primer controlled for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and included for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a preferentially co-inherited, and selecting for the SSR in the breeding, a comethod for DNA profilling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal company be used in the selection of genes in grass or cereal breeding, for profilling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profilling to establish the control of grass or cereal breeding, for distinct identity, uniformity and/or stability of a cultivar. The present

Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligaseassisted spacer addition assay

Example 10; Page 55; 89pp; English

The invention relates to a method of identifying or detecting a cucleotide repeat region in a nucleic acid molecule characterised by a comprision in a nucleic acid molecule characterised by a cucleotide repeat region in a nucleic acid molecule characterised by a cucleotide repeat region in a nucleic acid molecule characterised by a nucleotide repeat region in a nucleic acid molecule characterised by a particular in particular, the method is useful for identification of a mucleotide length polymorphism in animals or humans, which is a necleotide length polymorphism in animals or humans, which is casociated with a neurodegenerative disease including fragile x syndrome, be used for identifying and/or typing microorganisms including yeasts and compared in the method can be used for identification of microorganisms, and expecting certain cancers and other malignancies.

CC Muntingrows, the method can be used to provide markers for use in identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and conditor responses to therapies including the possibility of microorganisms, to ascertain parentage of human or non-human individuals, and to monitor responses to therapies including the possibility of crime, in gene mapping and population studies. LASA may also be used in forensic condense; the manufacture of a kit for detecting and/or identifying mucleotide crime, in gene mapping and population studies. LASA may also be used in the methods using gel electrophoresis and Southern transfer and and cost required by prior art methods using gel electrophoresis and Southern transfer and and the contract of automate or miniaturise. The LASA method avoids the time and cost required by prior art malaturise. The LASA method avoids the time and cost required subject polymorphisms or microsatellites as described in the method of the collimation of all aboratory procedures. ABK2476-ABK24313 represent primers used to contract polymorphisms or microsatellites as described in nventior

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method of typing (MI) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DMR region of (I) that includes PML, using as template a DMR sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML, and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, man metabolic proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                  Prion protein polymorphic microsatellite marker consensus sequence #12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. Th sequence represents a prion protein polymorphic microsatellite marker

The invention relates to a novel method for selecting highly-dormant wheat using a genetic marker associated with a gene that provides high dormancy to the seeds. In the method of the invention, the genetic marker exists specifically in the genetic region within 44 cM from the gene associated with high dormancy in chromsoome 4A. The method is useful for selecting highly-dormant wheat. This polynucleotide sequence represents a

                                                                                                                                                                                       The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by screening a library of bovine Mbol DNA fragments of between 250 and 500 by this and (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information of specification and indexed herein (see below). The sequence information of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

In crossatellite (using the program OPTIPRIM). The microsatellites may be microsatellite (using the program OPTIPRIM). The microsatellites may be applied to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits, and cattle, to allow selective.

The sequence is that of a bovine microsatellite sequence obtd. by

considering a library of bovine MboI DNA fragments of between 250 and 500

considering a library of bovine MboI DNA fragments of between 250 and 500

considering an (ADI)15 and and (TC)15 alignoutclectide probe. One out of 50

considering an analysis of Assuming independent distribution of

microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites

considering approach is estimated at >100, 000. The sequence information

for ca. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

constream of the microsatellite sequence waset to generate the

required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

contained to identify individuals, for parentage testing, and in the genetic

mapping of economic trait loci, or genes involved the determinism of

conomically important traits esp. in cattle, to allow selective

breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN field.)
repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65799-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf30 which contains the repeat sequence is from the marker clone Mdf30 which contains the repeat sequence having the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

```
which contain single nucleotide polymorphisms (SNPB). Sequences 1 to 1112

(AAA76318-A77429) are consecutive pairs of nucleotides which contain

Salent SNPB. Sequences 1131 to 1129 (AAA77430-A77509) are consecutive

pairs of nucleotides containing SNPS which result in changes in the

corresponding amino acid sequences (AAB1749-B11828). The SNPB in

corresponding amino acid sequences (AAB1749-B11828). The SNPB in

corresponding amino acid sequences (AAB1749-B11828). The SNPB in

corresponding amino acid sequences (AAB17446-A77503) result

corresponding amino acid sequences (AAA77446-A77503) result

corresponding amino acid detecting in sequences 1187 to 1192

changes to a method of detecting a polymorphic site in a nucleic acid and

camethod of determining the relatedness of two nucleic acids. It also

corresponding the antibodies. The nucleic acids are useful for

corresponding an individual having, suspected of having, or at risk of

developing a pathological condition due to the presence of a sequence

polymorphism. Such treatment would comprise administration of the wild-

cypetides can also be used in the treatment of such individuals
                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism.

                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers Anfe5799-f66047. Those clones where the repeat sequence has been determined are shown in AAT65704-777. This repeat sequence is from the marker clone Mdf52 which contains the repeat sequence is from the marker clone Mdf52 which contains the repeat sequence in first
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          formula: (AC)18TTG(CA)3.                                                                                                                                  The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTPIREM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trail loci, or genes involved the determinism of

The sequence is that of a bovine microsatellite sequence obtd. by

creening a library of bovine MboI DNA fragments of between 250 and 500

CD by with an (ACI)s and a (TC)15 oligonuclectide probe. One out of 50

CLONES cross-hybridised. Assuming independent distribution of

clones cross-hybridised. Assuming independent distribution of

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

CC in the bovine genome is estimated at >100, 000. The sequence information

for ca. 230 such bovine microsatellites is summarised in the

Specification and indexed herein (see below). The sequence information

CC downstream of the microsatellite sequence were used to generate the

CC downstream of the program of printerion of the corresp.

CM in vitro amplification of the corresp.

CM in crosatellite (using the program OPTIRRIW). The microsatellites may be

CM incrosatellite (using the program OPTIRRIW). The microsatellites may be

CM in apping of economic trait loci, or genes involved the determinism of

CM connected trait loci, or genes involved the determinism of

CM connected to dentify individuals. The microsatellites and the determinism of

CM connected to dentify individuals. The microsatellites are the connected trait loci, or genes involved the determinism of

CM connected the contract trait sep. in cattle, to allow selective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MooI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised Assuming independent distribution of microsatellites and MooI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and domonstream of the microsatellites sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               breeding. The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a farticular length, comprising employing ligase-assisted spacer addition (LASA) assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a nucleotide repeat region in a nucleic acid molecule characterised by a condition of particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, thuntington's disease, or muscular dystrophy. Purthermore, the method may condition and multi-cellular organisms, Purthermore, the method may condition of human and for genotyping subjects including humans. The method is also useful for detecting certain cancers and other malignancies.

Condition of human and non-human individuals, plants and identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and identification of human and non-human individuals, cand to monitor responses to therapies including the possibility of and to monitor responses to therapies including the possibility of crime, in gene mapping and population studies lash may also be used in the manufacture of a kit for detecting and/or identifying nucleotide repeat regions such as a nucleotide length polymorphism in a eukaryotic crepeat regions such as a nucleotide length polymorphism in a eukaryotic crepeat regions such as a nucleotide length polymorphism in a eukaryotic crepeat regions such as a nucleotide length polymorphism in a eukaryotic crepeat regions such as a nucleotide length polymorphism in eukaryotic crepeat regions such as a nucleotide length polymorphism in eukaryotic crepeat regions such as a nucleotide length polymorphism in eukaryotic crepeat regions euch detecting and condition transfer analysis. In particular, current diagnosis of H

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligaseassisted spacer addition assay.
                                                                                                                                                                                                                                                               The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used to defect these markers. Primers based on these sequences can be used to defect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf44 which contains the repeat sequence is from formula: (CA)17. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Microsatellite, ligase-assisted spacer addition assay; LASA, cancer; nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
                                                                                                                                                                    markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dc-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has the marker clone Mdf47 which contains the repeat sequence is from the marker clone Mdf47 which contains the repeat sequence having the formula: (AC)17.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                          sednences
                                                 Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The chromosomal localisation was assigned to the Angelman Syndrome/Prader-Willi Syndrome region at 15q11-13. The dinucleotide repeat was confirmed to be on chromosome 15 by PCR of somatic cell hybrids. (Updated on 25-MAR-2003 to correct PN field.)
in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traites esp. in cattle, to allow selective by reeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Parimers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. Those clones where the repeat sequence has been determined are shown in AATG5704-797. This repeat sequence has the marker clone Mdf6 which contains the repeat sequence is from the marker clone Mdf6 which contains the repeat sequence is from the marker clone Mdf6 which contains the repeat sequence lass formula: (CA)5AA(CA)13. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n - using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

                                                     The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers: primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Glones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf12 which contains the repeat sequence is from formula: (AC)11AT(AC)8A. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-737. This repeat sequence is from the marker clone Mdf42 which contains the repeat sequence is from the marker clone Mdf42 which contains the repeat sequence is from formula: (CA)16T(AC)3.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                       Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-977. This repeat sequence has been determined are shown in AAT65704-777. This repeat sequence is from the marker clone Mdf34 which contains the repeat sequence a from formula: (AC)4AT(AC)15. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.

Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.

Example 5; Page 14; 35pp; Japanese

The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AA298483-514 represent sequences from Haliotis discus, used in the method of the invention

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)nusing novel nucleic acid mols. as primers.

Claim 1; Col 13-14; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases ö Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a phage libraries with a synthetic poly(dc-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf105 which contains the repeat sequence is from formula: TCAAACACAA(AC)16. ```
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
compared by with an (AF)15 and and (TC)15 and and mboI sites, the frequency of (T6)n >9 microsatellites
and compared are setimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
downstream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
conomically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

```

having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has

The invention relates to the isolation of polymorphic repeat sequences

Disclosure; Col 9-10; 186pp; English.

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

WPI; 1997-042299/04.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of a bovine microsatellite sequence obtd. by

Screening a library of bovine MboI DNA fragments of between 250 and 500

Co screening a library of bovine MboI DNA fragments of between 250 and 500

Co by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

Co can cross-hybridised. Assuming independent distribution of

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

co in the bovine genome is estimated at >100, 000. The sequence information

co in the bovine genome microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

coperation and indexed herein (see below). The sequences upstream and

comparteam of the microsatellite sequence were used to generate the

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite in vitro amplification of the corresp.

coused to identify individuals, for parentage testing, and in the genetic

mepping of economic trait loci, or genes involved the determinism of

connection.

ö
The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n.(dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.9 paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. Those clones where the repeat sequence has by primers AATG579-TG647. Those clones where the repeat sequence is from the marker clone Mdf58 which contains the repeat sequence is from the marker clone Mdf58 which contains the repeat sequence having the formula: (CA)16.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

New transgenic mice having a genetically modified fibroblast growth factor receptor gene, useful as a model for human chondrodysplasia, e.g. achondroplasia characterized by shortening of the limbs, midface hypoplasia or large skull.
                                                                                                                                                                                                                                                                                                     The invention relates to an animal model for chondrodysplasia, more particularly, to a transgenic mouse model for achondroplasia. This transgenic mouse contains a fibroblast growth factor receptor 3 (FGFR3) gene including a G to A point mutation changing Gly to Arg in codon 380 in its genome. The transgenic mouse is useful as a model for FGFR-associated chondrodysplasia, particularly FGFR3 achondroplasia, e.g. shortening of the limbs, midface hypoplasia and large skull. This model may be exploited to gain better understanding of the disease and as an experimental model with which experimental therapy to chondrodysplasias for screening, developing and evaluating drugs with a potential of relieving or abolishing chondrodysplasia syndromes and/or symptoms. The present sequence is a PCR primer used to detect mouse FGFR3 allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphic bovine DNA markers – used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf3 which contains the repeat sequence is from formula: (CA)16C. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse; chondrodysplasia; achondroplasia; transgenic mouse; therapy; fibroblast growth factor receptor 3; FGFR3; limb; midface hypoplasia; large skull; drug screening; drug development; transgenic; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
                                                                                                                                                                                                                                                                                                                                                                                                  Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers. WPI; 1997-042299/04.

Disclosure; Col 9-10; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the

```
ö
repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA).(dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAF5798-R56047. Those clones where the repeat sequence has been determined are shown in AAF65704-797. This repeat sequence is from the marker clone Mdf20 which contains the repeat sequence is from formula: (AC)17. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf101 which contains the repeat sequence having the formula: (AC)17. (Updated on 25-WAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of concaining the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. Those close where the repeat sequence has by primers AAT65798-T6647. Those close where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf117 which contains the repeat sequence is from the marker clone Mdf117 which contains the repeat sequence having the formula: GCAGCAACAT(AC)16.5. The sequence is that of a bovine microsatellite sequence obtd. by

Screening a library of bovine Mbol DNA fragments of between 250 and 500

CC by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

CC clones cross-hybridised. Assuming independent distribution of

microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites

cc microsatellites and mborine microsatellites is summarised in the

for ca. 230 such bovine microsatellites is summarised in the

cc specification and indexed herein (see below). The sequence upstream and

downstream of the microsatellite sequence were used to generate the

cc macrosatellite using the program OPTIPRIM). The microsatellites may be

microsatellite using the program OPTIPRIM). The microsatellites way be

microsatellity individuals, for parentage testing, and in the genetic

used to identify individuals, for parentage testing, and in the genetic

cc mapping of economic trait loci, or genes involved the determinism of

preceding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

field.)

The invention relates to the identification of nucleic acid molecules (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the identification of nucleic acid molecules.                                                                                                                                                                                                                                                                                         (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype.

The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Albeimer's disease. Hypersensitivity diseases include multiple sclerosis and Albeimer's disease. Hypersensitivity diseases include multiple allergies, Type II hypersensitivities such as context with allergens that lead to

Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a VDeta gene repeat sequence.

Sequence 35 BP; 1 A; 0 C; 17 G; 17 T; 0 U; 0 Other;

ઠ ద

```
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonuclocide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
and mboI sites, the frequency of (T6)n >9 microsatellites
con the bovine genome is estimated at >100,000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comparteem of the microsatellite sequence waset to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymorphic bovine DNA markers - used in genetic identification, gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SXSXEEXB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone MdE108 which contains the repeat sequence laring the marker clone MdE108 which contains the repeat sequence having the formula: GTGGTAAAT(AC)16. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromsome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine Mbol DNA fragments of between 250 and 500

co by with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50

co lones cross-Pybridised. Assuming independent distribution of

colones cross-Pybridised. Assuming independent distribution of

microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

colones cub bovine microsatellites is summarised in the

coperation and indexed herein (see below). The sequences upstream and

specification and indexed herein (see below). The sequences upstream and

coperation of the microsatellite sequence waset to generate the

committee PCR primers for in vitro amplification of the corresp.

concept to identify individuals, for parentage testing, and in the genetic

cused to identify individuals, for parentage testing, and in the genetic

concomically important traits sep. in cattle, to allow selective

concomically important traits sep. in cattle, to allow selective

preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers APT65789-T6647. Those clone where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdfil9 which contains the repeat sequence is from formula: (AC)16. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

Human alpha-7 neuronal nicotinic acetylcholine receptor and related Claim 9; Page 63; 104pp; English Leonard S, Freedman WPI; 1999-288306/24 polymucleotides. Matches ઠે 셤

```
acetylcholine receptor (alpha7-hmAChR). Also described are: (1) a peptide encoded by (1); (2) a vector comprising (1); (3) a host cell transformed with a vector of (2); (4) a polymucleotide comprising at least 15 mucleotides which hybridises under stringent conditions to at least a portion of (1); (5) a method for detection of a polymucleotide encoding alpha 7-hnAChR in a biological sample; and (6) a method for amplification of nucleic acid from a sample suspected of containing nucleic acid encoding alpha 7-hnAChR. The primers and probes from the present invention can be used on brain tissue and blood samples of humans suspected of suffering from schizophrenia, small cell lung carcinoma, breast cancer and nicotine-dependent illness. This is particularly useful for diagnosed are epilepsy (e.g. juvenile myoclonic epilepsy) and prader-Willi and Angelman's syndromes
encoding at least a portion of the human alpha-7 neuronal nicotinic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 32 BP; 16 A; 16 C; 0 G; 0 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                      having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the phage libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65794-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf55 which contains the repeat sequence is from the marker clone Mdf55 which contains the repeat sequence having the formula: (AC)16. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                        Detection of polymorphic genetic markers of the form (dC-dA)\,n(dG-dT)\,n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                       sednences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; alpha-7 nicotinic receptor; neuronal; hybridisation; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences to prior art methods which are reliant on base sequences. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.

The present invention describes an isolated nucleotide sequence (I)

ð 셤

```
The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition particular. The method is useful in the identifying or detecting a concloctide repeat region in a nucleic acid molecule characterised by a nucleotide length. In particular, the method is useful for identification particular in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, associated with a neurodegenerative disease including fragile X syndrome, concerned to indentifying and/or typing microorganisms including yeasts and lower uni- and multi-cellular organisms, as well as prokaryotic concover, the method can be used to provide markers for use in Moreover, the method can be used to provide markers for use in Moreover, the method can be used to provide markers for use in moreorganisms, to ascertain parentage of human or non-human individuals, plants and microorganisms, to ascertain parentage of human or non-human individuals, conclicated to identify a particular victim or an alleged perpetrator of a conclicate acid damage. The nucleotide polymorphisms may be used in forme, in gene mapping and population studies. LASA may also be used in crime, in gene mapping and population studies. LASA may also be used in crime, in gene mapping and population studies. LASA may also be used in crepeat regions such as a nucleotide length polymorphism in a eukaryotic genome. The LASA method avoids the time and cost required by prior art methods using gel electrophoresis and southern transfer analysis. In

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dd-dA)n. (dd-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the page 1 libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly/(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated The inserts from the clones were amplified by primers AAT65799-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf107 which contains the repeat sequence is from formula: TGCCCGGCCT(AC)16. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                   ö
                       the use of gel electrophoresis, a process that has proved difficult to automate or miniaturise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primers used to detect polymorphisms or microsatellites as described in the method of the

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AF)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is unmmarised in the sequence information for specification and indexed herein (see below). The sequence supstream and commitream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The sequired PCR primers for in vitro amplification of the corresp.

The sequired pCR primers for in vitro amplification of the corresp.

The sequired pCR primers for in vitro amplification of the corresp.

The sequired pCR primers for in vitro amplification of the corresp.

The sequired pCR primers for in vitro amplification of the corresp.

The sequired pCR primers for in vitro amplification of the corresp.

The sequired pCR primers for in vitro amplification of the corresp.

rable 7; Page 202; 517pp; English. Polymorphic bovine DNA markers - mapping, and selective breeding.

```
The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 between 250 and 500 clones croses-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellite sequence were used to generate the sequence PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                       The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
corealing a library of bovine MboI DNA fragments of between 250 and 500
corealing and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
core 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
specification and indexed herein (see below). The sequences upstream and
downstream of the microsatellite sequence were used to generate the
crequired PCR primers for in vitro amplification of the corresp.
crequired lite (using the program oPTIPRIM). The microsatellites may be
microsatellite (using the program oPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
companies of economic trait loci, or genes involved the determinism of
connectly important traits esp. in cattle, to allow selective
connectly incorrect the construction of the correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                              Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
core forms (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
core cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
specification and indexed herein (see below). The sequences upstream and
committee of the microsatellite sequence were used to generate the
downstream of the microsatellite sequence were used to generate the
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
consomically important trait loci, or parentage testing, and in the genetic
economically important traits esp. in cattle, to allow selective
connomically important traits esp. in cattle, to allow selective
breeding. See also AAQ31501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphic bovine DNA markers - used in genetic identification, gene
                                                                                                                                                                                                                            Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                            The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites on the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information corespecification and indexed herein (see below). The sequences upstream and comnstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important trait loci, or genes involved the determinism of breeding. One out of 50 microsatellites and a (TC)15 oligonuclectide probe. One out of 50 microsatellites and Mbol sites, the frequency of (T6)n .9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of
for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traite sep. in cattle, to allow selective by receding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf79 which contains the repeat sequence is from the marker clone Mdf79 which contains the repeat sequence is from formula: (AC)15.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the phage libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65784-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf64 which contains the repeat sequence is from formula: (AC)15.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                      Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               94US-00222177.
```

```
(AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                           Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the identification of nucleic acid molecules
/standard_name= "single nucleotide polymorphism"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Repeat seguence from polymorphic marker clone Mfd111.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 31 BP; 7 A; 6 C; 15 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf57 which contains the repeat sequence is from formula: (CA)15.5. (Updated on 25-MAR-2003 to correct PF field.)

Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.
                                                                              repeats, especially for use in e.g paternity or maternity teeting, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdfill which contains the repeat sequence is from the marker clone Mdfill which contains the repeat sequence having the formula: CCACCCCCAG(CA)24.5.                                                                                                                                                                                                                            The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats. Primers based on these sequences can be used to detect these repeats. Sepecially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65794-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf111 which contains the repeat sequence is from the marker clone Mdf111 which contains the repeat sequence having the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

c encoding enzymes associated with drug metabolising. The invention relates
c encoding enzymes associated with drug metabolising caid sample using probes or
c polymorphism in such drug metabolising enzyme-encoding genes. The
c polymorphism may be identified in a nucleic acid sample using probes or
primers specific for a sequence selected from ABZ4317-ABZ50887 using a
variety of detection assays, including hybridisation assays, nucleic acid
arrays and PCR-based methods. The invention also encompasses methods of
c arrays and PCR-based methods. The invention also encompasses methods of
c arrays and prore bused in studying the relationship between
CC drugs. SNPs are also useful as polymorphism markers for discovering genes
cc drugs. SNPs are also useful as polymorphism markers for discovering genes
that cause or exacerbate certain diseases, SNPs are particularly useful
in the above respects as they are stable in populations, occur
that cause or exacerbate certain diseases. SNPs are particularly useful
in the above respects as they are stable in populations, occur
in the above respects as they are stable in populations, occur
in the above respects as they are stable in populations, occur
in the above respects as they are stable in populations, occur
in the above respects as they are stable in population, occur
in the above respects as they are stable in population, or occur
in the above respects are the guessork out of selection the drug with the
greatest therapeutic effect for a particular patient, but would also
c drugs theraples based upon the genetic profile of individual patients.

This would not only take the guessork out of selection for the invention are also useful in the drug discovery and
echods of the invention are also useful in the drug discovery and
c approval processes. For example, individuals could be selected for
c clinical trials only if their genetic profiles individuals could be responded for
c appropriate patient populations. The methods, data and compositions of
the invention may therefore le
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism and compositions for identifying individuals who have at least one polymorphisms and compositions for a sequence selected from ABZ4217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and pCR-based methods. The invention also encompasses methods of arrays and pCR-based methods. The invention also encompasses methods of arrays and pCR-based methods. The invention also encompasses methods of arrays and pCR-based methods. The invention also encompasses methods of polymorphism data, particularly that relating to single nucleotide polymorphism data. particularly that relating to single nucleotide polymorphism sequence variations and human diseases. SNPs are particularly useful in the above respects as they are stable in populations, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur in the above respects as they are stable in populations of polymorphisms of drug therapueit effect for a particular patient. Dut would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and appropriate patient populations. The methods of adverse and compositions of the invention may therefore lead to an increase in the range of possible drug candidates could be revived if they are action and adverse reactions. The methods of adverse range of the invention may therefore lead they are increase in the

CC primers and compositions for identifying intalvatuals who have at least come polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4317-ABZ5881 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphism (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes created to sequence or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur the according drug metabolising enzymes allows the customination of such as repeating sequences. The detection and analysis of polymorphisms cuch as repeating sequences. The detection and analysis of polymorphisms of up an essent dupon the geneswork out of selecting the drug with the drug therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously falled drug candidates could be revived if they were matched with more approvale processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and compositions of the invention may therefore lead to an increase in the range of reactions
                                                                                                                                                                                                 Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                      Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid

Claim 23; Page 76; 2785pp; English.

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates conceptions and compositions for identifying individuals who have at least to methods and compositions for identifying individuals who have at least come polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a craitey of detection assays, including hybridisation assays, mucleic acid articles and pre-based methods. The invention also encompasses methods of a variety of detection assays, including hybridisation assays, mucleic acid caraluting and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphism (SMPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful.

CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful.

CC drug therapies based upon the genetic profile of individual patients.

CC drug therapies based upon the genetic profile of individual patients.

CC This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety.

CC This would not only take the guesswork out of selecting the drug discovery and approval processes. For example, individuals could be selected for clinical trials only if that genetic profile and cauge drug candidates could be revived if they were matched with more appropriate patient populations. The embrode, data and compositions of the invention may therefore lead to a an increase in the rumber of adverse reactions, failed drug trials, the time patient

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n. (dc-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial analysis unto breading or pedigree analysis. The repeats, when analysed, fall into 4 categories: 1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent repeats of another sequence; 2) imperfect repeats which are defined as 2 consecutive non-repeat bases; 3) compound perfect repeats which are consecutive non-repeat bases; 3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases from a run of at least 5 uninterrupted dinucleotide or longer repeats from a run of at least 5 uninterrupted dinucleotide or longer repeats at 10 uninterrupted monouncleotides; and 4) imperfect compound repeats that the compound repeats around that the than a consecutive non-repeat bases to make than a consecutive non-repeat bases around the consecutive non-repeat bases around at least 5 uninterrupted dinucleotide or longer repeats of a sequence other than (dc-dA)n. (dc-dT)n, or from at least 2 consecutive and a least 3 consecutive non-repeat bases around a least 3 consecutive non-repeat bases around a least 3 consecutive non-repeat bases around a least 5 consecutive non-repeat bases around base and a least 5 consecutive non-repeat bases around base and bases around the least 5 consecutive non-repeat bases around the least 5 consecutive non-repeat bases around the le
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               least 10 uninterrupted mononuclectides; and 4) impertect compound repeat which are defined as for the perfect compound repeats except that the runs of CA are interrupted. This sequence is an example of an imperfect repeat sequence of structure: (CA)11CT(CA)4. (Updated on 25-WAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection of polymorphic genetic markers of the form (dG-dA) \, n \, (dG-dT) \, n using novel nucleic acid mols. as primers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdfill Which contains the repeat sequence laring the formula: (AC)15. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence core test (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primar cutable for amplifying an SSR, identifying (MI) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely a ssociated with the gene such that the SSR and the gene are contained for DNA profiling grass or cereal species varieties by assessing contained for DNA profiling grass or cereal species varieties by assessing contained for DNA profiling grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the present seed batches, and for DNA profiling to establish the genuity, uniformity and/or stablishty of a cultivar. The present sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                        more tandemly repeated nucleotide
                                                                                                                                                                                                                                                                                   New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (Acl)15 and a (TC)15 oilgonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.
                                                                                                                  new microsatellite DNA derived from a Pyrus plant and discrimination of
                                                                                                                                                                                                                                                                                         Pyrus plants. The invention also comprises a method for discriminating Pyrus plants - utilising the novel Pyrus microsatellite DNA. The novel microsatellite DNA sequence can be used in discriminating Pyrus plants.
                                                                                                                                                                                                                                                                                                                                                                                   The present DNA sequence represents a probe specific for a novel Pyrus pyrifolia (sand pear) microsatellite DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cattle; parentage;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2.6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a clarary of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely a sesociated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing.

The second of the selection of genes in grass or cereal seed batches by assessing varieties and testing the purity of grass or cereal seed batches by assessing varieties and testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the grass or cereal seed batches, and for DNA profiling to establish the grass or cereal section within seed batch of a classic profiling transpared by an analyzed by grass or cereal section of grass or cereal section within a cereal breeding, of grass or cereal section of grass or cereal preceding the purity of grass or cereal grass or cereal preceding the purity of grass or cereal grass or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                       New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species varieties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbo! DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbo! sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca 230 such bovine microsatellites is summarised in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

creening a library of bounder microsactiffe sequence Object. by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellites is summarised in the constream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

The sequence is that of a bovine microsatellite sequence obtd. by
conservation a library of bovine MboI DNA fragments of between 250 and 500
conservation and a (TC)15 oligomuclectide probe. One out of 50
conservation across-typridates. Assuming independent distribution of
conservation and MboI sites, the frequency of (T6)n >9 microsatellites
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
conservation and indexed herein (see below). The sequences upstream and
specification and indexed herein (see below). The sequences upstream and
constream of the microsatellite sequence ware used to generate the
compacted primers for in vitro amplification of the corresp.
consected in the groad operation of the corresp.
consected in mportant traits sep. in cattle, to allow selective
                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR, selection, primers, OpripRIM, breeding, cattle, parentage, genetic mapping, traits, amplification; ss.

The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine MboI DNA fragments of between 250 and 500

CC clones cross-hybridised. Assuming independent distribution of

CC clones cross-hybridised. Assuming independent distribution of

CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

in the bovine genome is estimated at >100, 000. The sequence information

CC for ca. 230 such bovine microsatellites is summarised in the

CS specification and indexed herein (see below). The sequences upstream and

CC downstream of the microsatellite sequence ware used to generate the

CC microsatellite (using the program OPTIPRIM). The microsatellites may be

CC used to identify individuals, for parentage teating, and in the genetic

CC used to identify individuals, for parentage teating, and in the genetic

CC mapping of economic trait loci, or genes involved the determinism of

CC conformically important traits esp. in cattle, to allow selective
                                                                                                                                                                                                                                     Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequence upstream and
comparream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites
cused to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
conomically important traits esp. in cattle, to allow selective

                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites of in the bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

C. used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits epp. in cattle, to allow selective

```
The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 ollgonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the septence information for ca. 230 such bovine microsatellites is summarised in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphic bovine DNA markers - used in genetic identification, gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ø
downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequences given in AAQ83339, AAQ83953 and AAQ839940 are used in the construction of an oligonuclectide clamp. The clamp is a comb-type branched polymer which has 5' termini and was used to bind a target compressing a segment of the HIV pol and nef genes in single stranded or double stranded forms. An oligonuclectide clamp is a compound complex after specifically binding to the target polynuclectide croular complex after specifically binding to the target polynuclectide complex after specific binding to the target molecule and one or more pairs of binding moieties cone or more oligonuclectide control of specific binding to the target molecule and one or more binding moieties covalently linked to the oligonuclectide polynuclectide, the binding moieties of a pair are bought into introperson to that they form a stable covalent or non-covalent linkage or complex. The interaction of the binding moieties effectively clamps the specifically annealed oligonuclectide moieties to the target the specifically annealed oligonuclectide moieties to the target copy polynuclectide. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The invention relates to the isolation of polymorphic repeat sequences markers. Primers based on these sequences can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 by primers AAT65799-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf10 which contains the repeat sequence is from the marker clone Mdf10 which contains the repeat sequence is from
repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(GC-dA). (GG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf6S which contains the repeat sequence is from formula: (CA)14.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detection of polymorphic genetic markers of the form (dC-dA) n(dG-dT)n using novel nucleic acid mols. as primers.
